STUDIO RAZAVI + PARTNERS

THE FIRM

STUDIO **RAZAVI** + PARTNERS is an international architecture and interior design practice spanning across Paris, London and New York.

We create sophisticated living, workplace & hospitality spaces relying on contemporary culture and craftsmanship as founding principles.

As a full service firm, we design buildings and interiors across a variety of typologies: single-family homes, condominiums, workplaces, art galleries, restaurants... Our commitment is to translate our clients' needs into memorable spatial experiences.

We service our clients - institutions, companies, private individuals - by setting up project specific teams to best respond to work phases and guide our clients through the full process of design and construction.

Licensed to practice in France, the United Kingdom and the United States, we have designed projects in Europe and the Americas.

MOUNTAIN HOUSE II

This house, located on the lower Alpine mountain regions, serves as a testimony of our evolving climate. A flat roof was not only authorized by the local building code but highly welcomed as long as it could host vegetation and contribute in increasing the building's thermal performance. South facing openings allow for greater thermal gain in winter while integrated shading devices prevent excess radiation in the summer. The building's structure is wood frame, finished simply with local stucco & stone window sills.

MOUNTAIN HOUSE

In this highly preserved Alpine valley, stringent architectural guidelines allow for little architectural freedom. Strict guidelines are enforced to protect the local heritage but de facto create endless pastiche mountain homes. To circumvent these limitations we first became familiar with the existing history and culture so as to understand what functionally drove the designs. We then integrated this into our design, avoiding all artificial or obsolete elements while making sure that the building was entirely code compliant from a heritage standpoint. The base is all cast in place and exposed concrete and the floors above all wood, structure and cladding. Window openings gradually open up as the space allows for it. Celebrating nature was of course the pinnacle. This comes as the final experience, up on the last floor, fully framing the view by extending the building envelope to the outside. So as to protect the experience, material selection is kept at minimal variety.

HOUSE FOR A PHOTOGRAPHER

The defining concept for this house, commissioned by a photographer as both his summer house and studio, was based on developed facade studies which define a simple and smooth building skin varied in height and punctured by openings. Two volumes define the main living & work spaces, both converge to the North corner freeing up as much space as possible on this small lot. The main space is compressed at the entry and releases up towards the landscape, the fan shaped plan gradually provides more floor area, volume and light. The second volume is exclusively dedicated to the photographer's studio. All rooms and bathrooms are reduced to a bare minimum and provide maximum surface area to living and work spaces. The varying angles at building edges offer a series of changing volumetric & perspective experiences (south facade reads as a single vertical plane). Similarly, an open angle on the main corridor defeats natural perspective to create an illusion of parallel walls.

FOREST HOUSE

This house is located in a dense wooded area and our wish was to profit from this remarkable natural context to create a great variety of experiences from the inside out. The plan is based on two intersecting squares and diamond shaped in elevation as to gradually de-materialize and blend with the trees, some over 200 years of age. The dark wood siding and large window openings contribute to create a sense of refuge, of nestled habitation out in the open.

MOUNTAIN HOUSE III

The driving force behind this design is the relation between nature and humans. Throughout history the defining criteria for dwelling has been the degree to which one felt shielded from outside forces and as technology (and our perception of nature) evolved, the degree to which we could re-open our experience of space to the outside. Each floor in this chalet is slightly cantilevered out with glazing mounted inbound by a foot so as to create a photographic framing device to the landscape. On the mountain facing side, the building is connected through a concrete footbridge that further outlines the different stages of dwelling.

MOUNTAIN HOUSE IV

We were tasked with the full refurbishment of this all-concrete 1980s chalet at the edge of a high-altitude French ski resort. Facade changes required landmarks approval and posed the challenge of modifying load-bearing concrete walls. In order to preserve the chalet's facade patina, interior layout changes were carefully considered for their exterior impact. This allowed a seamless transition from old to new, aspiring to form a coherent ensemble over time. Interiors focus on simple craftsmanship and emulating the high-altitude chalet experience, using a limited selection of materials. We created a hierarchy of openings to ensure each room offers unique experiences, making the house feel unified and harmonious.

93 PETIT

This building sits on a very large rectangular site with the shortest side facing the street. This specific criteria, combined with the necessity to maximize square footage helped us create a typology that responded not only to zoning restrictions but also created a series of differentiated buildings envelopes which help break down the overall scale. A total of four building blocks make up the project. The longest runs North-South to allow maximum sunlight exposure to the West, three remaining blocks run parallel to the street, opening both to North and South sides. The farther the building in the site, the shorter it is. Terraces set the buildings back to the East side, offering a more gentle scale to neighboring buildings. Brick was the material of choice in order to introduce yet another dimension and scale to our design and help, via the tactile properties of the material, create a more intimate scale and vibrant facades.

47 MALAKOFF

With each new development, towns and cities shape their identity and future appeal to new residents. In an era of sensible urban renewal, this project exemplifies how fresh designs can address contemporary challenges while preserving community identity. Our building's plot has two radically different scales on either side, which we wanted to highlight. The main road facade is a planar surface with terrace cutouts, while the opposite facade steps back to echo the scale of nearby single-family homes. The layout is based on a central vertical circulation core with apartments on either side and prefabricated concrete facade panels integrating planters. Using concrete prefabrication enhances structural integrity and detailing precision.

MAISON DE L'ITALIE

The Italian Foundation at the Cite Universitaire campus commissioned us to design their new building aimed at increasing their room capacity as well as creating a new Italian cafeteria on the ground floor. The only site available for this new building was a collection of constraints: proximity of existing building, proximity of remarkable trees, limited constructable footprint. To which we responded with a shape that seemed to be the only one to accommodate them all. A cylinder shaped building presents itself with its own sets of constraints but in this instance, the repetitive nature of identical bedrooms actually lent itself quite appropriately to the geometry. The concrete structure allows a clear expression of all floors plates and a set of columns lift the building off the ground so as to not interrupt the view corridor down to Le Corbusier's Swiss pavilion.

CENTRAL PARK CONDOMINIUM

The opportunity to imagine a new building facing Central Park, a few blocks from Frank Lloyd Wright's Guggenheim museum is as rare as it gets. What we offered was to celebrate both a rich urban fabric and the importance of renewal. Fernand Leger and Le Corbusier emphasized the importance of Form Contrasts as a means to bring about harmonies relevant to the post-classicist, machine age they lived in. Building over an existing Georgian brick townhouse, surrounded by imposing all-brick 5th avenue, Florentine inspired palazzo architecture, poses a similar design strategy challenge. Opposing large curved glass panes to flat brick surfaces, floor to ceiling openings to 19th century double hung window openings speaks not only about technical evolution, changing life styles but foremost about urban vitality.

The all-concrete 1960s building provided our primary source of inspiration when designing this headquarter for a Paris-based private equity firm. Walnut and travertine paneling set the tone for an intimate but sharp work environment, enhanced by a selection of furniture systems. A large central hallway functions as the office's "main street", connecting offices, meeting rooms, cafeteria etc. to create a constant flow and life in the workplace. All offices open up to the central hallway on one side and on to courtyards or gardens on the other, providing everyone with natural lighting.

AUGUST DEBOUZY

The past decade saw the advent of new spatial organizations in office design in response to the growing transformation of the workplace as new tools & methods were introduced, largely driven by technology firms. Concepts of flexibility, working remotely, co-working, blending residential & corporate design solutions took root. Slowly however, our own perception of this trend was challenged as notions of permanence and familiarity seemed to have been sacrificed to benefit a less formal approach. Our objective for this project is to create spaces that are here to age and not look obsolete as trends evolve. One way to accomplish this is to aim for a nuanced classicism and draw upon the great examples of corporate design over the past century. Connecting with past great designs not just as a show of admiration but also humility and strength, qualities that hopefully permeate and reflect a team's remarkable values.

WAKAM HEADQUARTERS

This full floor work space was designed for the oldest insurance company in France. A very specific brief had been put together by the client which required to design a “peaceful, see-through & fresh” space that would not only respond to contemporary work practices but also allow new, and at times unexpected, team interactions. We opted for materials that are not commonly thought of for work spaces and tried to use them sensibly to establish a core identity, combining wood, carpet & glass partitions. Pine was the wood of choice because of its very imperfections. Centrally located on the floor plate are “program islands” which allow existing structure to be concealed, create storage & a variety of other programs such as reception desk, stand-up meeting rooms and storage.

PRADIER ADDITION

Following its completion in the early 1900s, this private mansion was gradually transformed, first to be converted into an office building and then, starting in the 1950s, new floors were added with the last floor built in the 1980s. Because the top original floor had been demolished and the floors added had attempted to blend in, the end result had become an eyesore. However, because no one can afford to lose real estate, our proposed design offered to demolish all non-original floors and build an entirely different structure on top, preserving (and increasing) square footage but more importantly, making sure the new and old would celebrate each other. Particular emphasis was put on the threshold between the two buildings: the reduced footprint of the lower arches are here to signal a light interface, respectful & delicate. Sharply different finishes further provide contrast between the buildings.

Once a design has contributed defining a brand, growth poses an interesting challenge for architects. How does one convey an established identity and familiarity of brand while refraining from copy pasting previous designs over to a new location? Boqueria in Chicago is located in the West Loop, in the former industrial & meatpacking neighborhood of Fulton-Randolf District which is being currently gentrified. Most buildings, new & old, have retained an industrial look: large open floor plates with columns. Because these spaces are predominantly horizontal in proportion, our approach was to layer the information so the design in its totality would provide a clear understanding of how it is organized. Prevailing materials are wood and black tiles, both not only reminiscent of the original Boqueria but also because of the feelings associated with them. One taking on a nice patina over time, the other providing a feeling of permanence & protection throughout the space. All light fixtures have been custom designed to create a variety of lighting atmospheres but also as a reminder of the eclecticism of Boqueria.

BOQUERIA 40TH STREET

A restaurant concept derived from the famous Barcelona market housed under a single great roof structure, inspired us to create an all-encompassing atmosphere, not dissimilar to the market. Using only wood, our design intent was to mitigate the changing ceiling heights (some in excess of 20') with one varying surface made up of wood slats. These would then curve down to extend along walls to create a warm texture, which would gradually disappear as it reaches down. A centrally located bar becomes the prominent spatial element and stands out as a vital organ along with the open kitchen, opposite the main seating area, therefore surrounding clients with the two main features of what a tapas restaurant is all about.

DAVID ZWIRNER PARIS

The new David Zwirner gallery in Paris is located in a former sewing machine factory now under landmark preservation status because of the original steel & glass structure. Working in collaboration with Selldorf Architects, we meticulously redesigned the exhibition spaces, upgraded the glass for increased mechanical and fire rating. As a consequence of the increased load, the steel structure was modified but in such detailed fashion that it retains its original cast iron features. The combination of fritted glass and artificial lighting provides for an enhanced viewing experience. Separate viewing rooms and offices were given equal care for the art to be displayed in a variety of contexts.

For our second collaboration with Sotheby's we continued our spatial exploration of how a site specific exhibition design can impact the visitor's experience and create a new relationship with the art being shown. This time around, our design has a more minimal contact with floors, freeing up more circulation possibilities, perspectives. As we experienced it, it also created a more playful and dynamic behaviour with visitors as they sought to look around and make sure they had seen all the works.

SOTHEBY'S 2022

On the occasion of Sotheby's first Surrealism auction held in Paris, the wish was expressed to create a memorable experience for visitors, clients and online bidders. The Galerie Charpentier is a Parisian landmark with the main exhibition hall in a former (glass roof covered) courtyard, square in shape. Our objective was to create a space within this space with an expressed economy of means. Our design, an "open" cruciform plan which doubles the existing wall surfaces, offers multiple perspectives and a variety of circulation possibilities, while relying on its monolithic nature to both be stable and provide a sense of mass. The freestanding partitions are carved open in the center to allow Magritte's *La Joconde* to become a focal point of the exhibition from which one can walk around the galleries.

SOHO TRIPLEX

An existing duplex was combined with the top floor of this Soho building to create a single-family home with rooftop & terrace access. Two separate floor openings were devised, with a large bronze-finished helix acting as the house's central core and creating a feeling of generosity on an otherwise modest floor plate. A material palette comprising walnut, marble, glass, steel, bronze and finely woven fabrics, including custom designed furniture pieces and a selection of mid-century and contemporary designers, elevate the experience.

APARTMENT XVII

This is an apartment designed for a young scientist, living mostly alone. The XVIth century building is part of a uniquely preserved Renaissance neighborhood in the city of Lyon, France. Two massive stone fireplaces, oversized oak beams, 14 foot ceilings were some of the original features we intended to renovate & celebrate in the new space. A single bedroom and bathroom, in addition to living room, dining room and kitchen, made up the program. Relying primarily on the use of a single material with a limited color palette, we designed a series of events so as to create what we refer to as an "introspective space", a place to allow for reflexion, for creative seclusion. Wood floors, rough plasterwork on walls are the only other materials used, allowing for full potential of the space to be celebrated.

APARTMENT XVI

Across the street from the Luxembourg gardens, the building sits inside a 17th century hotel particulier courtyard. Man Ray, Hemingway and Jacques Prévert all lived across the street. The apartment belongs to a French American couple and this is their parisian home. Our brief was to transform the place into a warm & contemporary parisian apartment and allow as much flow between each room. The brief also required to provide mutiple opportunities to show an eclectic art collection, ranging from antiquities to contemporary works.

CLESSIDRA

Coffee table

A shape often explored in the past, the hourglass offers both tension and balance. Seen from above it also appears to be a weightless disc floating above ground and as one sits and lowers its sight-line, the base and connecting points are revealed. Taking on from this, two hourglasses of different diameters were merged to form a coffee table with the desired dimensions. Carved out of a single block, the table offers continuity of veins, rhythm and ever changing shapes as one turns around it.
